

c Where the reference is incomplete: novelty by gene, ancestry and nomenclature field

stack = non-coding (solid) · synonymous CDS (dotted) · new protein (hatched) · black bar = artifact rate (flat negative control) · grey whisker = how high the stack could reach if every suppressed count sat at its ceiling

d Allele-frequency spectrum, all 8 classical genes — novel alleles are overwhelmingly rare, known alleles are not counts divided by bin width, because the bins double in size and raw counts would show a sawtooth that is pure binning
